

The background of the slide features a team of cybersecurity professionals working at a control room. They are surrounded by multiple computer monitors displaying various security-related dashboards, logs, and code snippets. The overall atmosphere is dark and focused, with blue and black tones dominating the scene.

Definizioni

EDR	Endpoint Detection and Response
XEDR	e X tended Endpoint Detection and Response
XDR	e X tended Detection and Response
MDR	M anaged Detection and Response

Endpoint Detection and Response

Bitdefender®

La tecnologia di rilevamento e risposta che viene utilizzata per identificare comportamenti sospetti e minacce persistenti avanzate (APT) ed informare di conseguenza gli amministratori.

Lo fa raccogliendo e aggregando dati da **singoli endpoint**.

eXtended Endpoint Detection and Response

Bitdefender®

eXtended Endpoint Detection and Response è l'evoluzione delle soluzioni EDR
che aggiunge funzionalità di analisi e **correlazione degli eventi di sicurezza tra gli endpoint.**

eXtended Detection and Response

Bitdefender®

Il rilevamento e la risposta estesi funzionano **raccogliendo e correlando i dati da dispositivi di varia natura**, come endpoint, rete locale, domain controller, applicazioni cloud, cloud server.

XDR aumenta la quantità di informazioni, allargando lo sguardo su un numero più esteso di dispositivi, ed offrendo allo stesso tempo una visione sintetica ed efficace ai fini dell'analisi e della reazione in tempi rapidi.

Managed Detection and Response

Bitdefender®

Managed Detection and Response (MDR) indica **servizi** di sicurezza informatica **in outsourcing** progettati per tutelare i dati e le risorse anche se una minaccia elude i comuni controlli di sicurezza dell'organizzazione.

MDR prevede controllo di sicurezza avanzato **24 ore su 24, 7 giorni su 7**, che spesso include una serie di attività di sicurezza fondamentali, quali la sicurezza gestita dal cloud, per le organizzazioni che non possono mantenere il proprio centro operativo di sicurezza. I servizi MDR combinano **analisi avanzate, intelligence** sulle minacce ed **esperienza umana** nell'indagine sugli incidenti e nella risposta distribuita a livello di host e di rete.

XDR Extended Detection and Response

perchè XDR

Bitdefender®

- correlazione degli eventi fra dispositivi diversi
- intelligenza artificiale per la classificazione degli eventi (triage)
- ricerca degli indicatori di compromissione (Search, IOC Search)
- Blocklist, Custom Detection Rules e Custom Exclusion Roles
- Live Search sugli endpoint
- azioni di remediation (Block/Quarantine/Delete, Isolate, Patch, Remote shell, Disable Account)
- suggerimenti per la remediation

eXtended Detection and Response

Bitdefender®

Endpoints

- What happened within the endpoint?
- How did an attack propagate?
- What are the risks on the endpoints?

Network

- How is the attacker moving across the organization?
- How are threats communicating?

Productivity

- Who else received this email or similar threats?
- Are there compromised accounts sending internal phishing emails?

Piattaforma XDR

- What was the context in which malicious content was executed on the workload?
- What type of threat was prevented (e.g. malware, exploit)?

Cloud

- Who is logged on the device?
- Is the user supposed to be logged on the device?

Identity

- Which actors are behind this threat?
- Which verticals are these actors active on?
- Are there any other organizations experiencing the same attacks?

Threat Intel

XDR sensore Productivity

Productivity - MS 365

Analysis of cloud productivity suites/email to detect

Detection category	Example
Email exfiltration	A suspicious application (an application that requests read access to all users documents) was used to download files from a user's account
Spearphishing attempts	Users receive emails with spearphishing URLs in the body(correlation between EDR and O365)
Suspicious Mailbox Permissions created/updated	A certain user has received permissions to many mailboxes in a short amount of time
Suspicious User created/updated	A newly created user has been immediately excluded from MFA
Antiphishing Protection Disabled	A user has disabled/removed the phishing filter policy/rule
Documents with Macros re-uploaded on SharePoint/OneDrive	A user has downloaded a document and then re-uploaded it. The re-uploaded document contains macros that can be used to infect others
Executable File Uploaded to a different account	A user uploaded an executable file to a different Office365 account
Multiple Access Requests created in SharePoint	A user requested access to multiple files or directories on different sites in a very short amount of time
Multiple Emails Deleted in non-owned mailboxes	A user started to delete a large number of emails in mailboxes it doesn't own across multiple sites
Anomaly detection	A user had an unusual frequency of administrative activities or document manipulation activities in the last day.

and to respond

- Delete email across O365 organization
- Suspend O365 account

Bitdefender XDR Sensor - Productivity

Bitdefender®

Cosa fa

Collezione Email ed eventi di audit di MS365 e

- Correla gli eventi per creare nuovi incidents e/o completare gli esistenti
- Archivia gli eventi di audit per la ricerca storica

Come si attiva

- Acquisto licenza Add-On per XDR Sensor - Productivity
- Aggiungo il sensore alla console GravityZone e Configuro l'integrazione con MS365 (Configuration→Sensor Management→Add)

XDR sensore Identity

AVANGATE

Identity - Active Directory

Active Directory

Analysis of user behavior/identity to detect

Detection category	Example
Kerberos attacks	<ul style="list-style-type: none">An attacker is executing a brute force attack on a service server that uses Kerberos loginAn attacker is able to extract the TGS tickets from memory, or captures them by sniffing network traffic, and extracts the service account's password hash and attempts an offline brute force attack to obtain the plaintext passwordA Kerberos ticket with weak encryption was requested indicating Kerberoasting activityAn intruder steals a packet from the network and forwards that packet to a service or application as if the intruder was the user who originally sent the packet (replay attack)
Pass-the-hash attacks*	An attacker authenticates to a remote server or service by using the underlying NTLM hash of a user's password, instead of requiring the associated plaintext password as is normally the case
Pass-the-ticket attacks*	An attacker "pass the ticket" using stolen Kerberos tickets to move laterally within an environment, bypassing normal system access controls
Suspicious operations performed on AD object*	An attacker is performing various activities(create/update/delete/move) on an Active Directory object
DCShadow attacks*	An attacker registers a rogue Active Directory Domain Controller and uses that to inject malicious Active Directory objects (e.g. credentials) to other Domain Controllers that are part of the same Active Directory infrastructure.
Suspicious logins	A TGS request was granted after a brute-force attack

and to respond

- Disable AD account
- Force password reset for AD

Bitdefender XDR Sensor - Identity

Bitdefender®

Perchè

Active Directory è un obiettivo primario durante i cyber attacchi.

Statistiche su Active Directory

1. 90% delle imprese al mondo usa AD.
2. Gli attaccanti indirizzano 95 milioni di AD al giorno
3. 80% degli attacchi includono la compromissione di AD.

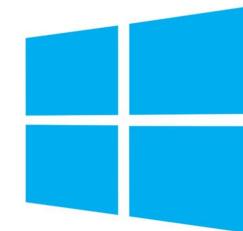

Cosa fa

Collezione gli eventi utente da on-premise AD ed Azure AD e poi

- Correla gli eventi per creare nuovi incidents e/o completare gli esistenti
- Archivia gli eventi per la ricerca storica

Come si attiva

- Acquisto licenza add-on per XDR Sensor - Identity
- Aggiungo il sensore alla console GravityZone e Configuro l'integrazione con AD (Configuration→Sensor Management→Add)
- L'integrazione con AD On-Premise richiede il modulo EDR Sensor di GravityZone installato su ciascun DC
- Azure AD richiede licenza Azure AD Premium P1 or P2

Active Directory

Cloud - AWS

Analysis of cloud providers to detect

Detection category	Example
Suspicious recognition activity on Lambda functions	<ul style="list-style-type: none">An attacker has listed lambda functions, downloaded one of themA lambda function executing a suspicious action by updating an assume role policy to allow external access
Recognition activity against S3 buckets	An attacker performs multiple Recon events against S3 buckets by listing various buckets, functions etc
User login from multiple regions	An attacker has logged in from multiple regions simultaneously
Deleted bucket encryption	An unfamiliar user or host removes default encryption from the S3 bucket exposing all objects that were encrypted (using server-side encryption) in that S3 bucket
Suspicious Ingress Port allowed via Lambda function	An attacker has executed a lambda function triggering a suspicious action by updating a security group to allow ingress on a port
Evading defenses by disabling/removing monitoring services	An attacker is attempting to delete audit data by stopping CloudTrail or by deleting a log group or stream from CloudWatch
Suspicious IAM user via Lambda function	An attacker has triggered a suspicious action by executing a lambda function that created an access key to backdoor an IAM user
AWS anomaly detection	<ul style="list-style-type: none">A user has performed actions that are outside of the baselineA file with a suspicious extension has been uploaded outside of the baselineA cloud function has been used to perform an action outside of the usual scope

Bitdefender XDR Sensor - Cloud

Bitdefender®

Perchè

Mancanza di visibilità delle attività sospette nell'amministrazione delle piattaforme cloud.

Cosa fa

Colleziona eventi da AWS e poi

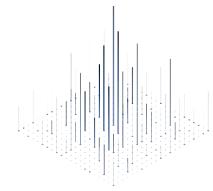

- Correla gli eventi per creare nuovi incidenti o completare gli esistenti
- Archivia gli eventi per consultazione storica.

Come si attiva

- acquisto licenza addon per XDR Sensor - Cloud
- In console GZ lo aggiungo alla gestione dei sensori e ne configuro l'integrazione con l'amministratore del tenant AWS.
Integrazione Cloud based (using AWS CloudTrail, AWS Config, Amazon SQS and Amazon SNS)
- Nota!: introduce dei costi addizionali sui servizi AWS per il cliente

Network

Analysis of internal and external traffic to detect

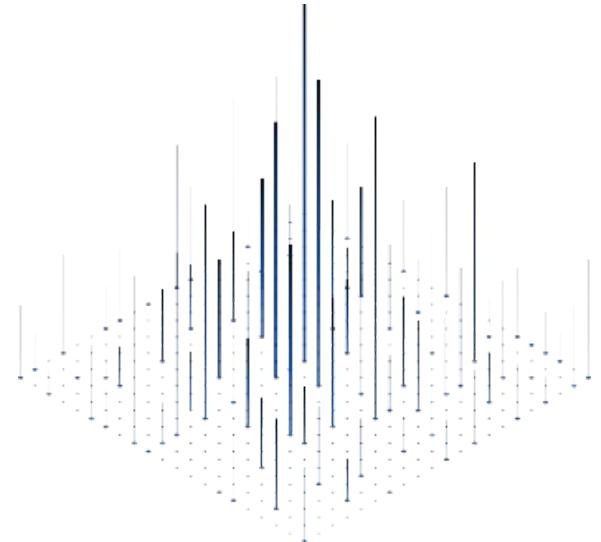

Detection category	Example
Lateral movement within the organization	An attacker is moving within the network
Data Exfiltration	An attacker exfiltrates data outside of the organization
Brute-force attempts	An attacker is trying to login into a system using brute-force
Port scanning	An attacker is leveraging external custom tools and open-source tools for port scanning in an attempt to map the network and devices

Bitdefender XDR Sensor - Network

Bitdefender®

Perchè

- Gli asset IT non sono fatti solo di Endpoint (anche IOTs, network devices, stampanti, etc).
- Le soluzioni EDR non sono in grado di rilevare attacchi che coinvolgono dispositivi diversi dagli endpoint, che NON possono essere protetti con un agent a bordo.

Cosa

Collezionare eventi relativi al traffico di rete e poi

- Correlare gli eventi per creare nuovi incidenti e/o completare gli esistenti
- Archiviare gli eventi per consultazione storica

Come

- Analizzando il flusso dati con dei sensori OnPremise
- Acquistando licenza add-on
- Implementando manualmente i sensori di rete nell'organizzazione.

SUMMARY

Created: 05 Apr 2022, 10:28:08
Last updated: 05 Apr 2022, 10:28:08
Type of attack: Exploit

A potential network breach originating from managed asset: WIN-10, has been detected as part of alert: Exploit.PentestingTool.HTTP.3, affecting the following: managed asset: BD-DC01 BD Lab.

Multiple communication attempts to 3 unmanaged assets, and managed asset: BD-DC01 BD Lab have been detected as part of 8 alerts, originating from managed asset: WIN-10.

ROOT CAUSE

The incident was triggered by an Exploit attempt originating in managed asset: WIN-10 involving managed asset: BD-DC01 BD Lab.

45 SuspiciousLogin Appears 2 times on 3 entities

51 SuspiciousLogin

53 SuspiciousLogin

The graph illustrates a complex network attack. It starts with multiple endpoints (Alice, BOB-PC, cloudfi...; bob, DC01.cloudfi..., administrator@cloudfi..., FILESERVER.cloud, FILESERVER2.cloud, CFO-PC.cloudfi...) sending various alerts (SuspiciousInternalEmailReceived, SuspiciousEmailReceived, Exploit NRPC CVE-2020-1472 ZeroLogon, SuspiciousLogin) to a central service (FILESERVER2.cloud). The central service then initiates a 'KerberosBruteForce' attack on another endpoint (FILESERVER.cloud). The timeline shows the progression of these events over time.

KerberosBruteForce

Severity: Medium
Sensor: Endpoint
Detected on: 01 Feb 2022 13:16
Kill Chain Phase: Persistence
Endpoint: BOB-PC.cloudfi.local
AD User: administrator@cloudfi.local

ALERT DETAILS
Possible brute force attack on a service server that uses kerberos login.
